

Harvest Cadence

Press Farm, Yountville. Expected weekly yield per crop, built from one full year of Press Farm OS delivery records, August 2025 through July 2026. Generated July 30, 2026.

How to read this

Each table shows one crop per row. The number in a month column is the average quantity delivered per week during that month. A blank cell means nothing was delivered that month. The shaded cell is the crop's strongest month. The Year column is the total delivered over the whole year.

These numbers come from the delivery log, which records what actually left the farm for the kitchens. That makes this a record of proven demand, not a guess. If a crop shows 2 LG per week in June, the kitchens actually took that much last June, and planting to match it is safe.

Units

- **EA** means each. Individual pieces, counted one by one. Used for nasturtium leaves, radishes, turnips, squash blossoms, violas and stone fruit.
- **LG** means large container and **SM** means small container. Most herbs, flowers and leaves move in these.
- **QT** means quart. Cilantro, radish flowers and some mustard flowers move by the quart.
- **GB** means green bin, the large harvest bin used for bulk items like branches, cucumbers and salad heads.
- **LBS** is pounds, **BX** is box, **CS** is case. Bulk summer crops like tomatoes and peppers move by weight.

Container counts

- French marigold, about 50 blossoms per LG. Puff ball marigold, about 9 per LG. Gem marigold, about 100 per LG.
- Lettuce is cut and come again by the leaf, about half a head per LG.

Demand baseline

PRESS covers 100 to 200 per day on weekends and 30 to 100 per day on weekdays. This cross checks against the Ox Heart carrot rate of about 450 per week at half a carrot per guest. Under-Study takes 150 to 300 pieces of tiny vegetables weekly. Deliveries run Thursday, Saturday and Monday, ordered by the chefs the night before.

Edible flowers

Numbers are average quantity per week for that month. Shaded cell is the peak month. Year column is the annual total.

The marigold question, answered from the data

Press Farm OS tracks marigold types as separate items, so container counts are per type, not a combined total. Over the last year the generic Marigold item, which is the French type, peaked at about 5 LG plus 16 SM per week in September and runs 1 to 2 LG per week in early summer. Gem Marigold is newer in the log and runs about 1 LG or a couple SM per week since April 2026. Gem Marigold Leaf is its own item at 1 to 2 LG per week. Puff Ball Marigold was added to the catalog in June 2026 and has no deliveries logged yet. So the working figure of 2 to 3 LG per week reads as per type at current pace, with the French type historically capable of much more in September.

Answered from Press Farm OS

- **How greens and herbs are counted.** Almost everything moves in LG and SM containers. Cilantro and radish flowers go by the quart. Salad mixes go by LG or green bin. Piece counted crops are nasturtium leaves, radishes, turnips, squash blossoms, violas and stone fruit.
- **Under-Study volume.** The tiny vegetable claim holds. Under-Study took radishes at roughly 380 EA per delivery week and one 3,300 turnip flush in May, plus about 67 nasturtium leaves per week and around 26 flower bouquets per week in summer.
- **Nasturtium scale.** The single biggest count crop. About 32,500 leaves per year, running 500 to 1,100 EA per week most of the year, with PRESS taking most of it.

Still open, needs Micheal

- Days each restaurant is open and which days count as weekend for the cover math. Not recorded in the OS.
- Physical size of the LG and SM containers. The OS treats them as labels only.
- Which crops are plated components versus garnish. The data hints at it, piece counted items read as plated and container items read as garnish, but the kitchens should confirm.
- Logged carrot deliveries, about 4,200 EA over the season with 3,500 in January, sit below the 8,500 bulk harvest figure. Walk in draws may not be fully logged. Worth reconciling before planting to the log number.
