Executive Summary

Press Farm has moved from a side-of-the-plate herb supplier into a **structurally profitable, fast-growing specialty produce operation** with one anchor customer. Three findings define the situation:

- 1 Growth is real and accelerating.** Realized revenue rose from \$34.2K (half-year 2024) to \$102.5K (full-year 2025). The first five months of 2026 delivered \$42.3K — **up 103% on the same period last year**. This is not seasonal noise; it is a step-change in volume and price realization.
- 2 The economics are unusually clean.** Across 24 months the farm booked ~\$180.8K of revenue against ~\$34.4K of cash inputs — a 19% input-cost ratio, of which nearly half is one-time equipment buildout. The constraint on the business is not cost; it is throughput and channel.
- 3 The risk is concentration, not demand.** 96% of revenue comes from a single restaurant (Press), and 13% of all-time revenue comes from a single crop (Nasturtium). The franchise is healthy but fragile on two axes — one customer, one hero SKU.

THE "SO WHAT"

2026 is on track to close at ~\$120–125K (base case), roughly +20% on 2025. The upside to a \$145K+ year and a \$200K+ 2027 is available — but it is gated almost entirely by **channel diversification**, not by the farm's ability to grow product. The single highest-value move over the next 18 months is converting the second and third restaurant accounts from a rounding error into 25–30% of revenue.

EXHIBIT 1

The growth curve — revenue per delivery is doing the work

Period	Revenue	Deliveries	Avg / delivery
2024 (Jul–Dec, partial)	\$34,182	115	\$297
2025 (full year)	\$102,501	209	\$490
2026 (Jan–Jun YTD)	\$44,122	87	\$507

Delivery count roughly held flat year-over-year while revenue per delivery rose ~65% from 2024 to 2026. Growth is coming from basket value and price — more premium SKUs per drop — not from running the truck more often. That is the high-margin way to grow.

01 Situation Assessment

1.1 Like-for-like proof point

Stripping out seasonality by comparing identical calendar windows:

EXHIBIT 2

January–May revenue, year-over-year

Window	2025	2026	Change
Jan–May revenue	\$20,850	\$42,279	+103%

A doubling on a clean like-for-like basis is the single most important fact in this review. Whatever changed between early 2025 and early 2026 — catalog depth, pricing discipline, the move off Excel onto the ordering system — **it worked, and it should be protected and pressed.**

1.2 Cost structure

EXHIBIT 3

Cash inputs, trailing 24 months

Category	Spend	Share	Character
Equipment	\$15,635	45%	Largely one-time / capitalizable buildout
Seeds	\$9,051	26%	Recurring biological input
Plants	\$3,511	10%	Recurring
Soil	\$2,895	8%	Recurring
Amendments / supplies / software / other	\$3,337	10%	Mixed
Total cash inputs	\$34,429	100%	

Recurring biological inputs run ~\$650–900 per month. Against revenue of \$7–15K in peak months, **gross input margin in season exceeds 90%**. This is a land-and-labor business, not a materials business.

DATA GAP — FLAG FOR ACTION

Labor and farmer pay are effectively **not captured in the system** (38.8 logged hours, \$0 entered rates). True *net* margin therefore cannot be computed from the database; the ~\$12K/quarter farmer-pay figure lives outside the data.

Recommendation: log labor for one full month so the reporting stack can show real net, not just contribution.

02 Revenue Anatomy

2.1 Customer concentration — the central risk

EXHIBIT 4

Revenue by account, all-time

Restaurant	Revenue	Deliveries	Share
Press	\$174,271	392	96.4%
Under-Study	\$5,778	16	3.2%
Events	\$756	3	0.4%

This is the headline risk. The business is, financially, **a single-account supplier**. Press is a strong, growing, loyal account — but the loss, relocation, or chef turnover of that one relationship would erase the franchise overnight. Under-Study exists in the system but has never been activated as a real channel.

2.2 Product concentration

EXHIBIT 5

Revenue by category and hero SKUs

Category	Revenue	Units	Share
Herbs & leaves	\$69,102	84,023	38%
Fruit & veg	\$61,619	14,093	34%
Flowers	\$40,019	5,085	22%
Microgreens	\$9,599	744	5%
Kits	\$466	25	<1%

Top SKUs: Nasturtium **\$23,751 (13% of the entire business)**, Carrots \$17,138, Radish \$9,745, Mustard Flowers \$7,650, Squash \$6,803, Basil \$6,732, Tomatoes \$6,198, Figs \$5,312. The **top three crops account for 28% of all revenue**.

- **Strength:** the farm has found genuine hero products. Nasturtium and edible flowers are exactly the high-margin, hard-to-source, chef-pull items a small farm should anchor on.
- **Fragility:** a Nasturtium crop failure, a pest year, or a chef rotating off the garnish is a 13% revenue event. Microgreens — the highest-controllability, weather-independent line — is only 5% of revenue despite a dedicated production module.

2.3 Seasonality

EXHIBIT 6

Average monthly revenue, two-year basis

* January is inflated by a historical data backfill; normalized, it behaves as a ~\$5–6K shoulder month. Dark bars = peak; light bars = trough.

The shape is unambiguous: **a strong Aug–Nov harvest season (~\$45K of the year) and a soft Dec–Mar shoulder.** The strategic question every year is the same — how do you put revenue into the Dec–Mar trough? That is precisely what microgreens, value-added product, and protected production are for.

03 Outlook — Rest of 2026

The farm is at the start of its strong half. H1 2026 has banked **\$44.1K**; the Aug–Sep peak is still ahead. Three scenarios for full-year 2026, anchored on the 2025 H2 actual of \$75.5K and demonstrated year-over-year momentum:

EXHIBIT 7

Full-year 2026 scenarios

Scenario	H2 2026 assumption	FY 2026	vs 2025
Bear	H2 softens to ~\$62K (peak underperforms, weather)	~\$106K	+4%
Base	H2 ≈ 2025 + modest growth, ~\$78K	~\$122K	+19%
Bull	2026 momentum carries, H2 ~\$100K	~\$144K	+41%

The bull case is genuinely reachable **if and only if the Aug–Sep peak is supplied to its full demand** — meaning the binding constraint this summer is production capacity and harvest labor, not orders. Plan crew and succession plantings now for the peak that is already visible.

NEAR-TERM WATCH ITEMS — NEXT 90 DAYS

- June is running light (\$1.8K through the 11th). Normal shoulder, but confirm July succession plantings are in to hit the August ramp.
- Protect the Nasturtium and flower lines — together 35% of revenue, and peak season is their season. A failure here is the single biggest miss available.
- Activate Under-Study for real before peak. Even a few hundred dollars a week from a second account compounds into both revenue and de-risking.

04 Outlook — 2027 and Beyond

4.1 The base trajectory

If the farm simply holds its current trajectory — same accounts, same catalog, continued price and basket maturation — **2027 lands around \$135–155K** and growth naturally decelerates toward a single-account ceiling. You can only sell so much to one kitchen.

4.2 The three levers that change the slope

The difference between a \$150K plateau and a \$250K+ business is not farming harder. It is three structural moves, in priority order:

Lever 1 — Channel diversification (highest value). Moving from one active account to 3–4 is the unlock. The system is already built for it — multi-restaurant ordering, magic-link chef accounts, the Events channel, offer sheets. If Under-Study plus two new

Napa Valley kitchens reach even half of Press's run-rate, that is **+\$60–80K per year** and cuts single-account risk from 96% to ~50%. **This is the #1 recommendation of this review.**

Lever 2 — Fill the winter trough. Dec–Mar averages ~\$4K/month against an Aug–Sep ~\$13–14K. Microgreens (weather-independent, already a built production module at only 5% of revenue) plus value-added/preserved product can realistically add **\$3–5K/month of off-season revenue** — smoothing cash flow and repositioning the farm as a year-round supplier rather than a seasonal one.

Lever 3 — Mix shift toward flowers & micros. Flowers already throw off \$40K at the highest revenue-per-unit in the catalog (5,085 units → \$40K, versus herbs' 84,023 units → \$69K). Edible flowers and microgreens are where small acreage produces the most dollars per square foot and the most defensible chef pull. Tilting the crop plan another 5–10 points toward these categories raises revenue without more land.

EXHIBIT 8

Illustrative 2027–2028 path — targets tied to account math, not growth rates

	2026 (base)	2027 (target)	2028 (target)
Active restaurant accounts	1.x	3	4–5
Revenue	~\$122K	~\$185K	~\$260K
Single-account share	~95%	~60%	~45%
Winter-month floor	~\$4K	~\$7K	~\$9K

Targets are deliberately tied to account count and product mix rather than a growth percentage — because that is the actual driver. Hit the account math and the revenue follows.

05 Strategic Imperatives

EXHIBIT 9

Five imperatives, ranked

#	Imperative	Why it matters	Horizon
1	Sign and activate two new restaurant accounts	Breaks 96% single-account risk; largest revenue lever; system already supports it	Next 6 months
2	Supply the Aug–Sep peak to full demand	The bull-case \$144K year is won or lost in 8 weeks; plan crew + succession now	This summer
3	Grow microgreens + flowers to ~35% of mix	Highest \$/sq-ft, weather-independent, fills the winter trough	6–18 months
4	Log labor & farmer pay in the system	Without it, net margin is invisible and pricing decisions fly blind	Immediate
5	De-risk the Nasturtium dependency	13% of revenue in one crop — add backup plantings / second flower heroes	This season

06 Risks & Watch-Outs

Risk	Severity	Mitigation
Single-customer dependency — 96% in one account	High / structural	Imperative 1. This is the risk that matters.
Single-crop dependency — Nasturtium at 13%	Medium	Diversify hero SKUs; backup plantings
Key-person / chef turnover — rotating chef staff at Press	Medium	The ordering system + order accountability already institutionalize the relationship; keep investing
Weather / biological — concentrated in Aug–Nov window	Medium, seasonal	Microgreens and protected production are the hedge
Measurement blind spot — labor uncaptured, net margin unknown	Low, fixable	Cheap to fix; valuable before any pricing or hiring decision

Methodology & notes. Revenue = realized deliveries.total_value / delivery_items.line_total — the financial source of truth per business rules, not order intent. Figures exclude farmer pay/labor (not captured in the database). Coverage: July 2024 – June 11, 2026 (24 months); June 2026 partial. The January 2026 figure is inflated by a historical delivery backfill; normalized seasonality treats January as a ~\$5–6K shoulder month. Forecasts are scenario estimates built on 2025 H2 actuals and observed year-over-year momentum — directional planning numbers, not guarantees. Input-cost ratios are cash inputs only; equipment (45% of spend) is largely one-time buildout. · Press Farm OS, Yountville, CA.
